

## How to minimize radio interference

Some devices may cause interference with your WiFi signal if they are within close proximity to your modem/gateway. If possible, try removing or turning off the sources of potential interference.

Try to relocate the following away from your modem/gateway and WiFi devices:

- Baby monitors
- Wireless security cameras
- Cordless telephone base stations
- Microwaves
- Wireless speaker systems
- Certain monitors and LCD displays

To improve performance, try moving those devices away from your modem/gateway. If the interference persists, contact the device manufacturer for additional troubleshooting.

Installing [Xtend WiFi](#) can help with WiFi congestion.
